Reading Response #1

Based on my reading for Busting the Tube: A Brief History of Video Art by Kate Horsfield. I was able to understand the evolution of digital arts. I was surprised to learn that in the 1960s, it was a time of social change where the Civil Rights Movement turning the creative side into activism. Television programming became the start of a creative interpretation of how new technology can transform society. Digital video artists developed art with television or rather something that is very ordinary from what we see in old movies.

Digital media art is always changing and being presented differently and uniquely. Although the art created in the past was mostly black and white but was something to be changing. These videos can be seen as confusing and dull, but it is a way where people can improve more creativity. Digital art doesn't have to be set into the same old artwork, but we create art to see how the world view society. With all of this technology such as Processing.js and Blender, it makes it accessible for people to make digital media art and create a new artistic style that we have not yet to discover. Digital arts is going to continue evolving with no limitation to creativity.
