ART 75

24 February 2020

Augmented Reality is one of the biggest technology trends and with AR implemented in smartphones, it's becoming accessible for people to use. What crossed my mind the similarities, but differences in virtual reality vs. augmented reality. Virtual reality is a more computer-generated environment for you to interact with. While augmented reality is you would ordinarily see it rather than replacing it.

Augmented Reality is presented as a futuristic technology. One of the popular AR app, "Pokemon Go" where it is interactive to users. It gives the audience a virtual world where they can interact, such as video games, mobile apps, and games. AR is very interesting and can be explored in many different ways. In which it demonstrates contemporary technological expression.
